**Hyperbolic structures on the complement of a hypertorus arrangement**

*Abstract.* For an irreducible root system with adjoint torus  $H$  and Weyl group  $W$ , let  $H^\circ$  be the complement of the mirror hypertorus arrangement. On  $H^\circ$  there exists a one parameter family of  $W$ -invariant hyperbolic structures. We discuss the condition on the parameter for which  $W \backslash H^\circ$  can be compactified to a ball quotient by a lattice group.
